Physics III: Decays and Low Energy Processes

Geant4 Tutorial at MIT

21 June 2016
Dennis Wright
Decay and Low Energy Processes

Geant4 includes processes at low energies to ensure full coverage of interactions with materials

- Particle decays
- Optical photon interactions

Recently added partial support for solid-state (crystal) interactions

- Phonon propagation
- Electron/hole propagation
- Crystal channeling
Particle Decays

- Decay can happen in flight or at rest
  - Derived from G4VRestDiscreteProcess

- Applies to all unstable, long-lived particles
  - Not used for radioisotopes (G4RadioactiveDecay)

- Different from other physical processes
  - mean free path for most processes: \( \lambda = \frac{N \rho \sigma}{A} \)
  - for decay in flight: \( \lambda = \gamma \beta c \tau \)
  - for decay at rest: \( \lambda \rightarrow \tau \)

- Same process used for all eligible particles
  - retrieves branching ratios and decay modes from decay table stored for each particle type
Particle Decay Models Available

Phase space

- 2-body: $\pi^0 \rightarrow \gamma \gamma$
- 3-body: $K^0_L \rightarrow \pi^0 \pi^+ \pi^-$
- many body

Dalitz

- $P0 \rightarrow \gamma l^+ l^-$

Muon and tau decay

- $V – A$, no radiative corrections, mono-energetic neutrinos

Semi-leptonic K decay

- $K \rightarrow \pi l \nu$
Defining Decay Channels

Geant4 provides decay modes for long-lived particles

- user can re-define decay channels if necessary

But decay modes for short-lived (e.g. heavy flavor) particles
not provided by Geant4

- user must “pre-assign” to particle:
  - proper lifetime
  - decay modes
  - decay products

- process can invoke decay handler from external generator
  - must use G4ExtDecayer interface

Take care that the pre-assigned decays from generators do not overlap with those defined by Geant4 (e.g., $K_S^0$, $\tau$)
Specialized Particle Decays

G4DecayWithSpin

• produces Michel electron/positron spectrum with 1\textsuperscript{st} order radiative corrections
• initial muon spin is required
• propagates spin in magnetic field (precession) over remainder of muon lifetime

G4UnknownDecay

• only for not-yet-discovered particles (SUSY, etc.)
• discrete process – only in-flight decays allowed
• pre-assigned decay channels must be supplied by user or generator
Optical Processes

Propagation of optical photons and their interaction with materials is treated separately from regular electromagnetic processes. Why?

- Wavelengths are much larger than atomic spacing
- Treated (partially) as waves; no smooth transition to gammas
- Energy/momentum not generally conserved in G4 optics

Optical photons produced directly by three processes

- G4Cerenkov
- G4Scintillation
- G4TransitionRadiation
Optical Photon Transport

- Rayleigh scattering
- Refraction and reflection at boundaries
- Bulk absorption
- Wavelength shifting

Geant4 keeps track of polarization
- but not overall phase, so no interference

Optical properties attached to G4Material (by user code)
- reflectivity, transmission efficiency, dielectric constants, surface properties, including binned wavelength/energy dependences

Photon spectrum attached to G4Material (by user code)
- scintillation yield, time structure (fast, slow components)
Optical Boundary Processes

G4OpBoundaryProcess
- refraction
- reflection

User must supply surface properties using G4OpticalSurfaceModel

Boundary properties
- dielectric-dielectric
- dielectric-metal
- dielectric-black material

Surface properties
- polished
- ground
- front- or back-painted, …
Reflection or Refraction?

Geant4 events reflect “particle-like” behavior – no “splitting” of tracks

Each event has either a reflected or refracted photon, chosen randomly from user-input efficiencies
Optical Processes: Wavelength Shifting

Handled by G4OpWLS

- initial photon is killed, one with new wavelength is created
- builds its own physics table for mean free path

User must supply:

- absorption length as function of photon energy
- emission spectra parameters as function of energy
- time delay between absorption and re-emission
Optical Bulk Processes

G4OpAbsorption

- uses photon attenuation length from material properties to get mean free path
- photon is simply killed after a selected path length

G4OpRayleigh

- elastic scattering including polarization of initial and final photons
- builds its own physics table (for mean free path) using G4MaterialTable
- may only be used for optical photons (a different process provided for gammas)
A group of Geant4 collaborators has been developing tools to support some solid-state physics processes:

- Phonon propagation and scattering
- Electron/hole production and drift
- Crystal channeling of charged particles

A common feature for these processes is the need to define a “lattice structure” (numerical parameters) for a volume.

Some of these tools (phonon propagation) were released in 10.1.
Lattices

Geant4 treats materials as uniform, amorphous collections of atoms. Steps may be of any length, in any direction, and some atom will be at the destination for interaction.

We have introduced \texttt{G4LatticeLogical} as a container to carry around parameters and lookup tables for use with the phonon handling processes.

There is a singleton \texttt{G4LatticeManager} which keeps track of lattices, and how they’re associated with materials and volumes.
Phonons in Geant4

See examples/extended/exoticphysics/phonons

The processes developed so far support acoustic phonons, which are relevant for low-temperature (tens of mK) detectors.

Three polarization states are recognized

- Longitudinal (G4PhononLong)
- Transverse “slow speed” (G4PhononTransFast)
- Transverse “fast speed” (G4PhononTransSlow)

Currently no production process. Use G4ParticleGun to insert a phonon, which then propagates through volume.
Phonon Propagation

Phonons are assigned a wave vector $\vec{k}$ for their phase velocity.

- Group (propagation) velocity $v_g$ is different due to the lattice anisotropies.
- `G4LatticeLogical` has a lookup table to convert between the two.
Phonon Interactions

Three phonon processes are currently written, though may not be fully functional.

**G4PhononScattering** Treats scattering of phonons off of isotopic impurities or lattice defects, changing direction and randomizing the polarization state (mode mixing).

**G4PhononDownconversion** Longitudinal phonons split in two, either $L \rightarrow L' T$ or $L \rightarrow T T$

**G4PhononReflection** Should handle reflection of phonons of volume boundaries; currently just kills.
Generate phonons at the center of one face of a germanium crystal, and measuring the distribution of phonons on the opposite face. Focusing produces a pattern of caustics.

Caustics in Ge collected by phonons example

Caustics in Ge observed by Northrop and Wolfe
PRL 19, 1424 (1979)
Electron/hole Transport

Energy-momentum relation (band structure) in Ge is highly anisotropic

• Eight equivalent minima (right)
• Electron develops a mass tensor
• Mass tensor diagonalizes in coordinate system aligned with symmetry axis
• Two components, $m_{\parallel}$ and $m_{\perp}$, remain

Electrons travel along, scatter between valleys (minima)
Holes drift along electric field lines
Electron vs. Hole Propagation in E Field

Electrons travel along valleys

Holes travel along field lines

Electric Field
Charged particles (including holes) drifting through crystal can generate low-energy phonons along their trajectories

- analogous to Cerenkov photons

“Non-ionizing energy loss” can be calculated and stored by a few standard processes

Code in development produces phonons which propagate as described previously.
Comparison of G4 and Matlab simulations of CDMS crystals, R. Agnese, UFL
• Crystal can be used as a primary collimator to deflect particles of the halo toward a secondary collimator.

• Main advantage is the possibility to deflect the beam out and reduce the beam losses.
Nuclear Dechanneling Length

\[ L_n = (1.53 \pm 0.35 \pm 0.20) \text{ mm} \]

\[ L_n = (1.31 \pm 0.05) \text{ mm} \]
Channeling Efficiency vs. Angle

UA9 collaboration simulations (a)
Geant4 Simulations (b)
Summary

Geant4 provides decay processes for all long-lived elementary particles

- Short-lived are yet-to-be-discovered particles can also be treated with decay files and special classes

A versatile optical photon package provides all basic low energy photon interactions with volumes and surfaces

- particle-like approximation to wave-like physics

Phonon propagation in crystals is now available

- a developing area
- watch for future developments
